Q. We built our house about 5 years ago. Using a slab foundation. We installed 18" Travertine tiles in the Kitchen and Baths. a membrane was not used between the tile and the slab. The slab has cracked and the tile cracked with it in many locations. I saved about 15 tiles in case this happened, but now 15 tiles is not enough.

Can these cracks be repaired like Marble or Granite?

Gilbert- If they are structural no they can't be fixed. If it is random tiles then yes they can. You need a bona fide stone refinisher to evaluate the situation.
