I applied MB-4 stone impregnator today. Where it was poured on the counter top (carerra white honed Marble) It sat for about 15 seconds before I got to start spreading it. The original spots that we stagnant for those few seconds left a stain. Is that actually in the marble or on the surface where it can be taken out. What can i do to remove those marks from the stone. Help me, Ryan

Dear Ryan:

Quite honestly I don't understand the nature of this... stain.

Could you be more descriptive?

What does this stain look like?

Is it darker than the rest of the stone?

Is it some of the impregnator that was left to dry on the surface of the stone?

Let me know and then I will be able to tell you what to do.

Ciao and good luck,

Maurizio Bertoli
